$$\text{Response to } \textbf{25\%;} \tag{-1}$$

$$\text{This is my corrective action and (my) letter (to you).} \tag{0}$$

1 Overview

1.1 Goal

$$\text{Objective: Build / Compare Two Factor-Based L/S Allocation Models} \tag{1}$$

$$\text{Beta } (\beta) \text{ Constraints} \tag{2}$$

$$\text{First Strategy } (S_{\{1\}}) : \text{Target Beta } \beta_T \in [-0.5, 0.5] \tag{3}$$

$$\text{Second Strategy } (S_{\{2\}}) : \text{Target Beta } \beta_T \in [-2, 2] \tag{4}$$

$$S_{\{1\}} \approxeq \text{Value-at-Risk Utility (Robust Optimization)} \tag{5}$$

$$S_{\{2\}} \Leftarrow \text{Information Ratio} \tag{6}$$

$$\text{Post Optimization: Model Comparative Analysis (Estimator Length Sensitivity)}$$

$$[\text{Covariance Matrix } \boldsymbol{\Sigma} \wedge \text{Expected Returns } \boldsymbol{\mu}] : \ R_j \ \forall \ j \in \{1, 2, \dots, M\} \tag{8}$$

1.2 Reallocation

$$\text{Portfolio Allocation } \{P_t\} \Leftarrow \text{`03-01-2007`} \sim \text{`03-31-2024`} \tag{9}$$

$$P_t \quad \forall \, t \in \{t_0, t_1, t_2, \dots, t_n\} \quad \text{where} \quad t_0 = \text{03-01-2007}, \quad t_n = \text{03-31-2024} \tag{10}$$

$$t_i = t_{i-1} + 7 \text{ days} \quad \text{for} \quad i = 1, 2, \dots, n \tag{11}$$

$$\text{Investment Universe} \equiv \text{ETFs ('Global World Economy')} \tag{12}$$

$$\text{Fama–French Three-Factor Model (Momentum, Value, Size)} \tag{13}$$

$$\text{Public Data} \tag{14}$$

1.3 Performance Evaluation

The performance / risk profiles are sensitive to the target Beta and the market en

$$\text{Low Beta} \Rightarrow \text{Decorrelation;} \tag{16}$$

$$\text{High Beta} \equiv \text{Antithesis.} \tag{17}$$

$$\text{Portfolio Characteristics:} \tag{18}$$

$$\bullet \qquad \text{Return} : \mu \tag{19}$$

$$\bullet \qquad \text{Volatility (Vol)} : \sigma \tag{20}$$

$$\bullet \qquad \text{Skewness (Skew)} : \mathbb{E}\left[\left(\frac{x - \mu}{\sigma}\right)^3\right] = \frac{\mu_3}{\sigma^3} = \frac{\kappa_3}{\kappa_2^{3/2}} \tag{21}$$

$$\bullet \qquad \text{Value at Risk (VaR) / Expected Shortfall (ES)} \tag{22}$$

$$\bullet \qquad \text{Sharpe Ratio} : \frac{\mathbb{E}[R_a - R_b]}{\sigma_a} = \frac{\mathbb{E}[R_a - R_b]}{\sqrt{\mathbb{V}(R_a - R_b)}} \tag{23}$$

1.4 Simplification

$$\text{Look-Back } \boldsymbol{\mu} \text{ Estimators} : \tag{24}$$

$$\bullet \qquad \text{Long-Term Estimator (LTE)} : \text{LT} \Rightarrow \text{LB} \in \{180 \text{ Days}\} \tag{25}$$

$$\bullet \qquad \text{Mid-Term Estimator (MTE)} : \text{MT} \Rightarrow \text{LB} \in \{90 \text{ Days}\} \tag{26}$$

$$\bullet \qquad \text{Short-Term Estimator (STE)} : \text{ST} \Rightarrow \text{LB} \in \{40 \text{ Days}, 60 \text{ Days}\} \tag{27}$$

$$\text{Term-Structure for Covariance } \boldsymbol{\Sigma} \ \wedge \ \text{Expected Return } \boldsymbol{\mu}. \tag{28}$$

1.5 Synthesis

$$\text{Optimal portfolio behavior constructed from} \tag{29}$$

$$\text{covariance and expected return estimators} \tag{30}$$

$$\text{will vary due to strategic and market differences.} \tag{31}$$

$$S_{40}^{90} \equiv \hat{\boldsymbol{\Sigma}} \Rightarrow 40 \text{ Days} \ \wedge \ \hat{\boldsymbol{\mu}} \Rightarrow 90 \text{ Days} \tag{32}$$

$$\text{Objective:} \tag{33}$$

$$\bullet \qquad \text{Evaluate Hypothesis} \tag{34}$$

$$\bullet \qquad \text{Demonstrate Robustness (Or Lack Thereof)} \tag{35}$$

- $\qquad$ Market Regime Stratification $\qquad$ (36)

2 Strategy

Theory \& Math

2.1 Strategic Formulation

Consider two strategies :

$$
\text{(Strategy I)} \quad
\begin{cases}
\max_{\omega \in \mathbb{R}^n} \; \rho^T \omega - \lambda \sqrt{\omega^T \Sigma \omega} \\[2ex]
-0.5 \leq \sum_{i=1}^n \beta_i^m \omega_i \leq 0.5 \\[2ex]
\sum_{i=1}^n \omega_i = 1, \quad -2 \leq \omega_i \leq 2,
\end{cases}
\tag{37}
$$

and

$$
\text{(Strategy II)} \quad
\begin{cases}
\max_{\omega \in \mathbb{R}^n} \; \dfrac{\rho^T \omega}{\text{TEV}(\omega)} - \lambda \sqrt{\omega^T \Sigma \omega} \\[2ex]
-2 \leq \sum_{i=1}^n \beta_i^m \omega_i \leq 2 \\[2ex]
\sum_{i=1}^n \omega_i = 1, \quad -2 \leq \omega_i \leq 2,
\end{cases}
\tag{38}
$$

- $\Sigma \equiv$ covariance matrix between security returns (FF3FM);

- $\beta_i^m = \frac{\text{Cov}(r_i, r_M)}{\sigma^2(r_M)} \equiv$ Beta of security S_i (CAPM) s.t.
  $\beta_P^m = \sum_{i=1}^n \beta_i^m \omega_i \equiv$ Porfolio Beta;

- $\text{TEV}(\omega) = \sigma(r_P(\omega) - r_{\text{SPY}}) \equiv$ Tracking Error Volatility;
  trivial derivation (reader exercise) :

$$
\sigma(r_P(\omega) - r_{\text{SPY}}) = \sqrt{\omega^\intercal \Sigma \omega - 2\omega^\intercal \text{Cov}(r, r_{\text{SPY}}) + \sigma_{\text{SPY}}^2}.
\tag{39}
$$

2.2 Fama–French Three-Factor Model (FF3FM)

$$
\text{Definition:} \tag{40}
$$

$$
r_i = r_f + \beta_i^3 (r_M - r_f) + b_i^s r_{\text{SMB}} + b_i^v r_{\text{HML}} + \alpha_i + \epsilon_i
\tag{41}
$$

$\mathbb{E}[\epsilon_i] = 0; \therefore$

$$\rho_i = r_f + \beta_i^3(\rho_M - r_f) + b_i^s \rho_{\text{SMB}} + b_i^v \rho_{\text{HML}} + \alpha_i \tag{42}$$

$$\text{Estimated Coefficient Vector:} \tag{43}$$

$$(\hat{\beta}_i^3, \hat{b}_i^s, \hat{b}_i^v)^\mathsf{T} \Leftarrow y_i = \rho_i - r_f \tag{44}$$

$$\text{Linear Regression:} \tag{45}$$

$$= \hat{\beta}_i^3(\rho_M - r_f) + \hat{\beta}_i^s r_{\text{SMB}} + \hat{b}_i^v \rho_{\text{HML}} + \epsilon_i \tag{46}$$

$$\beta_i^m \neq \beta_i^3 \mid \text{estimated via separate regression / computed directly.} \tag{47}$$

2.3 Executive Summary Formulation

$$\text{Innumerate:} \tag{48}$$

$$\text{Strategy I} \tag{49}$$

$$\text{1. Objective} \equiv \text{Maximize Returns w/Risk.} \tag{50}$$

$$\text{2. Constraints :} \tag{51}$$

- $$\text{The portfolio's beta must be between } -0.5 \text{ and } 0.5. \tag{52}$$

- The sum of the weights assigned to each asset in the portfolio must equal 1.

- $$\text{Each individual weight can range from } -2 \text{ to } 2. \tag{54}$$

$$\text{Strategy II} \tag{55}$$

$$\text{1. Objective} \equiv \text{Maximize Returns Relative to Tracking Error Volatility (TEV).}$$

$$\text{2. Constraints :} \tag{57}$$

- $$\text{The portfolio's beta must be between } -2 \text{ and } 2. \tag{58}$$

- The sum of the weights assigned to each asset in the portfolio must equal 1.

- $$\text{Each individual weight can range from } -2 \text{ to } 2. \tag{60}$$

3 Assumptions

3.1 Setup

$$1. \text{ Reallocation}: \text{'03-01-2007'} \sim \text{'03-31-2024'} \tag{61}$$

$$2. \text{ Input Construction}: \tag{62}$$

$$\bullet \quad \text{LT LB Period}: n_{\text{LT}} = 120 \mid \Sigma_s \wedge \mu_s \mid \text{LT} \equiv S_{120} \tag{63}$$

$$\bullet \quad \text{MT LB Period}: n_{\text{LT}} = 90 \mid \Sigma_s \wedge \mu_s \mid \text{MT} \equiv S_{90} \tag{64}$$

$$\bullet \quad \text{ST LB Period}: n_{\text{LT}} = 40 \mid \Sigma_s \wedge \mu_s \mid \text{MT} \equiv S_{40} \tag{65}$$

$$3. \ \boldsymbol{\beta}_T \in \{0, 1\} \tag{66}$$

$$4. \ \boldsymbol{\lambda} \in \{0.10, 0.50\} \tag{67}$$

3.2 Period Analysis

$$\text{Period Stratification}: \tag{68}$$

$$\bullet \quad \text{Period 1} \equiv \text{Pre-Subprime} \tag{69}$$

$$\bullet \quad \text{Period 2} \equiv \text{Subprime} \tag{70}$$

$$\bullet \quad \text{Period 3} \equiv \text{Post-Subprime} \tag{71}$$

$$\bullet \quad \text{Period 4} \equiv \text{COVID} \tag{72}$$

$$\bullet \quad \text{Period 5} \equiv \text{Post-Covid} \tag{73}$$

3.3 BackTesting

$$\text{Definition: Historical Data} \Rightarrow \text{Performance} \tag{74}$$

$$\text{Logistical Considerations}: \tag{75}$$

$$\bullet \quad \text{BackTest} \neq \text{Forecasts} \Rightarrow \textbf{Snooping Bias / P-Hacking} \tag{76}$$

$$\bullet \quad \text{Weekly Rebalance} \tag{77}$$

$$\bullet \quad \{t_i\}_{i=1}^n : \tag{78}$$

$$\begin{cases} \text{For the initial date } t_1, \text{ use the prior 60 days of historical data to estimate input} \\[1.5em] \text{Store the portfolio weights: } \omega_{t_1}. \\[1.5em] \text{For each subsequent date } t_{i+1}, \text{ roll the historical data window by 5 days, re-est} \\[1.5em] \text{Store the new portfolio weights: } \omega_{t_{i+1}}. \\[1.5em] \text{Repeat this process until the target date } t_n \text{ is reached.} \end{cases}$$

4 ToolKit|Arsenal

$$\text{Strat I} \Rightarrow \texttt{CVXPY} \mid \text{Strat II} \Rightarrow \texttt{Nonlinear Optimizer} \tag{80}$$
